A projecting, strip-type part is provided on the inner wall of the
line and runs spirally in the longitudinal direction of the line.
This part then winds around the longitudinal centre axis of the
line in equal coils. The projecting part (1) is in the form of a
fillet, which is directed to the ideal centre line in radial
alignment. The fillet is of a flexible material. An internal
sealing tube (2) is connected with the spiral-shaped fillet (1).
The cross-section of the fillet has the profile of a triangle or
trapezium with the tip pointing to the longitudinal centre line.
